Docker Configuration via /etc/docker/daemon.json

Prevent Creation of dynamic iptables rules, disable userland proxy

```
{
        "iptables": false,
        "ip-masq": false,
        "userland-proxy": false
}
```

Create iptables rules manually

```
iptables -A FORWARD -s $dockernetwork -m tcp -p tcp -m conntrack --ctstate
NEW -j ACCEPT
```

Configure DNS server

```
{
        "dns": ["192.168.100.254"]
}
```

Activate IPv6

```
{
    "ipv6": true,
    "fixed-cidr-v6": "fd00:fd00::/64"
}
```

Just “ipv6” is not enough - docker daemon will not start with an error message about non-overlapping IPv6 network.

linux, docker
