

Configure Elasticsearch/Kibana for TLS and Authentication

1. Shutdown elk-cluster
2. Add certificate path to elasticsearch config in docker-compose.yml

```
volumes:  
  - ./certs:/certs
```

3. Start elasticsearch

```
$ docker-compose up -d elasticsearch
```

1. Create certificates

```
$ docker exec -it elk-test-elasticsearch bash  
  
[root@elk-test-elasticsearch elasticsearch]# bin/elasticsearch-certutil  
ca -pem -ca-dn "cn=Elastic Stack CA"  
This tool assists you in the generation of X.509 certificates and  
certificate  
signing requests for use with SSL/TLS in the Elastic stack.  
  
[ ... ]  
  
If you elect to generate PEM format certificates (the -pem option),  
then the output will  
be a zip file containing individual files for the CA certificate and  
private key  
  
Please enter the desired output file [elastic-stack-ca.zip]:  
[root@elk-test-elasticsearch elasticsearch]# unzip -d /certs/ elastic-  
stack-ca.zip  
  
[root@elk-test-elasticsearch elasticsearch]# bin/elasticsearch-certutil  
http  
  
## Elasticsearch HTTP Certificate Utility  
  
[ ... ]  
  
## Do you wish to generate a Certificate Signing Request (CSR)?  
  
[ ... ]  
  
Generate a CSR? [y/N]n  
  
## Do you have an existing Certificate Authority (CA) key-pair that you
```

```
wish to use to sign your certificate?  
  
[ ... ]  
  
Use an existing CA? [y/N]y  
  
## What is the path to your CA?  
  
CA Path: /certs/ca/ca.crt  
  
## What is the path to your CA key?  
  
/certs/ca/ca.crt appears to be a PEM formatted certificate file.  
In order to use it for signing we also need access to the private key  
that corresponds to that certificate.  
  
CA Key: /certs/ca/ca.key  
  
For how long should your certificate be valid? [5y]  
  
[ ... ]  
  
Generate a certificate per node? [y/N]y  
  
## What is the name of node #1?  
  
This name will be used as part of the certificate file name, and as a  
descriptive name within the certificate.  
  
You can use any descriptive name that you like, but we recommend using  
the name  
of the Elasticsearch node.  
  
node #1 name: elk-test-elasticsearch  
  
## Which hostnames will be used to connect to elk-test-elasticsearch?  
  
[ ... ]  
  
Enter all the hostnames that you need, one per line.  
When you are done, press <ENTER> once more to move on to the next step.  
  
elk-test-elasticsearch  
  
You entered the following hostnames.  
  
- elk-test-elasticsearch  
  
Is this correct [Y/n]y  
  
## Which IP addresses will be used to connect to elk-test-
```

```
elasticsearch?
```

```
Enter all the IP addresses that you need, one per line.  
When you are done, press <ENTER> once more to move on to the next step.
```

```
[ ... ]
```

```
You did not enter any IP addresses.
```

```
Is this correct [Y/n]y
```

```
## Other certificate options
```

```
The generated certificate will have the following additional  
configuration  
values. These values have been selected based on a combination of the  
information you have provided above and secure defaults. You should not  
need to  
change these values unless you have specific requirements.
```

```
Key Name: elk-test-elasticsearch  
Subject DN: CN=elk-test-elasticsearch  
Key Size: 2048
```

```
Do you wish to change any of these options? [y/N]n  
Generate additional certificates? [Y/n]n
```

```
## What password do you want for your private key(s)?
```

```
Your private key(s) will be stored in a PKCS#12 keystore file named  
"http.p12".  
This type of keystore is always password protected, but it is possible  
to use a  
blank password.
```

```
If you wish to use a blank password, simply press <enter> at the prompt  
below.
```

```
Provide a password for the "http.p12" file: [<ENTER> for none]
```

```
## Where should we save the generated files?
```

```
A number of files will be generated including your private key(s),  
public certificate(s), and sample configuration options for Elastic  
Stack products.
```

```
These files will be included in a single zip archive.
```

```
What filename should be used for the output zip file?  
[/usr/share/elasticsearch/elasticsearch-ssl-http.zip]
```

```
Zip file written to /usr/share/elasticsearch/elasticsearch-ssl-http.zip
```

```
[root@elk-test-elasticsearch elasticsearch]# unzip -d /certs/
elasticsearch-ssl-http.zip
Archive:  elasticsearch-ssl-http.zip
  creating: /certs/elasticsearch/
  inflating: /certs/elasticsearch/README.txt
  inflating: /certs/elasticsearch/http.p12
  inflating: /certs/elasticsearch/sample-elasticsearch.yml
  creating: /certs/kibana/
  inflating: /certs/kibana/README.txt
  inflating: /certs/kibana/elasticsearch-ca.pem
  inflating: /certs/kibana/sample-kibana.yml
```

2. Configure elasticsearch for TLS & X-Pack Security

1. Shutdown elasticsearch

```
$ docker-compose down
Stopping elk-test-elasticsearch ... done
Removing elk-test-elasticsearch ... done
Removing network elk-test_default
```

2. Add certificate to docker-compose

```
volumes:
  -
    ./elasticsearch/config/elasticsearch.p12:/usr/share/elasticsearch/
    config/elasticsearch.p12:ro
```

3. Copy P12 file to correct place

```
cp certs/elasticsearch/http.p12
elasticsearch/config/elasticsearch.p12
```
