Configure Elasticsearch/Kibana for TLS and Authentication

Create Certificates

- 1. Shutdown elk-cluster
- 2. Add certificate path to elasticsearch config in docker-compose.yml

```
services:
   elasticsearch:
    volumes:
        - ./certs:/certs
```

3. Start elasticsearch

```
$ docker-compose up -d elasticsearch
```

4. Create certificates

```
$ docker exec -it elk-test-elasticsearch bash
[root@elk-test-elasticsearch elasticsearch]# bin/elasticsearch-certutil
ca -pem -ca-dn "cn=Elastic Stack CA"
This tool assists you in the generation of X.509 certificates and
certificate
signing requests for use with SSL/TLS in the Elastic stack.
[ \dots ]
If you elect to generate PEM format certificates (the -pem option),
then the output will
be a zip file containing individual files for the CA certificate and
private key
Please enter the desired output file [elastic-stack-ca.zip]:
[root@elk-test-elasticsearch elasticsearch]# unzip -d /certs/ elastic-
stack-ca.zip
Archive: elastic-stack-ca.zip
   creating: /certs/ca/
  inflating: /certs/ca/ca.crt
  inflating: /certs/ca/ca.key
[root@elk-test-elasticsearch elasticsearch]# bin/elasticsearch-certutil
http
## Elasticsearch HTTP Certificate Utility
[ ... ]
```

```
## Do you wish to generate a Certificate Signing Request (CSR)?
[ ... ]
Generate a CSR? [y/N]n
## Do you have an existing Certificate Authority (CA) key-pair that you
wish to use to sign your certificate?
[ ... ]
Use an existing CA? [y/N]y
## What is the path to your CA?
CA Path: /certs/ca/ca.crt
## What is the path to your CA key?
/certs/ca/ca.crt appears to be a PEM formatted certificate file.
In order to use it for signing we also need access to the private key
that corresponds to that certificate.
CA Key: /certs/ca/ca.key
For how long should your certificate be valid? [5y]
[ ... ]
Generate a certificate per node? [y/N]y
## What is the name of node #1?
This name will be used as part of the certificate file name, and as a
descriptive name within the certificate.
You can use any descriptive name that you like, but we recommend using
the name
of the Elasticsearch node.
node #1 name: elk-test-elasticsearch
## Which hostnames will be used to connect to elk-test-elasticsearch?
[ ... ]
Enter all the hostnames that you need, one per line.
When you are done, press <ENTER> once more to move on to the next step.
elk-test-elasticsearch
```

http://fortytwo.adurias.org/ Printed on 2025/11/26 08:07

You entered the following hostnames.

- elk-test-elasticsearch

Is this correct [Y/n]y

Which IP addresses will be used to connect to elk-testelasticsearch?

Enter all the IP addresses that you need, one per line. When you are done, press <ENTER> once more to move on to the next step.

[...]

You did not enter any IP addresses.

Is this correct [Y/n]y

Other certificate options

The generated certificate will have the following additional configuration

values. These values have been selected based on a combination of the information you have provided above and secure defaults. You should not need to

change these values unless you have specific requirements.

Key Name: elk-test-elasticsearch

Subject DN: CN=elk-test-elasticsearch

Key Size: 2048

Do you wish to change any of these options? [y/N]n Generate additional certificates? [Y/n]n

What password do you want for your private key(s)?

Your private key(s) will be stored in a PKCS#12 keystore file named "http.p12".

This type of keystore is always password protected, but it is possible to use a

blank password.

If you wish to use a blank password, simply press <enter> at the prompt below.

Provide a password for the "http.p12" file: [<ENTER> for none]

Where should we save the generated files?

A number of files will be generated including your private key(s), public certificate(s), and sample configuration options for Elastic Stack products.

```
These files will be included in a single zip archive.

What filename should be used for the output zip file?
[/usr/share/elasticsearch/elasticsearch-ssl-http.zip]

Zip file written to /usr/share/elasticsearch/elasticsearch-ssl-http.zip

[root@elk-test-elasticsearch elasticsearch]# unzip -d /certs/elasticsearch-ssl-http.zip

Archive: elasticsearch-ssl-http.zip

creating: /certs/elasticsearch/
inflating: /certs/elasticsearch/README.txt
inflating: /certs/elasticsearch/sample-elasticsearch.yml

creating: /certs/elasticsearch/sample-elasticsearch.yml

creating: /certs/kibana/
inflating: /certs/kibana/README.txt
inflating: /certs/kibana/elasticsearch-ca.pem
inflating: /certs/kibana/sample-kibana.yml
```

Configure elasticsearch for TLS & X-Pack Security

1. Shutdown elasticsearch

```
$ docker-compose down
Stopping elk-test-elasticsearch ... done
Removing elk-test-elasticsearch ... done
Removing network elk-test_default
```

2. Add certificate mount to docker-compose

```
volumes:
    -
./elasticsearch/config/elasticsearch.p12:/usr/share/elasticsearch/confi
g/elasticsearch.p12:ro
```

3. Copy P12 file to correct place

```
$ cp certs/elasticsearch/http.p12
elasticsearch/config/elasticsearch.p12
$ sudo chown 1000:1000 elasticsearch/config/elasticsearch.p12
$ sudo chmod 600 elasticsearch/config/elasticsearch.p12
```

4. Update elasticsearch.yml

```
$ grep xpack elasticsearch/config/elasticsearch.yml
xpack.security.enabled: true
xpack.security.http.ssl.enabled: true
xpack.security.http.ssl.verification_mode: "certificate"
xpack.security.http.ssl.keystore.path: "elasticsearch.p12"
```

http://fortytwo.adurias.org/ Printed on 2025/11/26 08:07

5. Start elasticsearch

```
docker-compose up -d elasticsearch
Creating network "elk-test_default" with the default driver
Creating elk-test-elasticsearch ... done
```

6. Create Users

```
$ docker exec -it elk-test-elasticsearch bash
[root@elk-test-elasticsearch elasticsearch]# bin/elasticsearch-setup-
passwords auto
Initiating the setup of passwords for reserved users
elastic,apm_system,kibana,kibana_system,logstash_system,beats_system,re
mote monitoring user.
The passwords will be randomly generated and printed to the console.
Please confirm that you would like to continue [y/N]y
Changed password for user apm_system
PASSWORD apm system = ***
Changed password for user kibana_system
PASSWORD kibana system = ***
Changed password for user kibana
PASSWORD kibana = ***
Changed password for user logstash_system
PASSWORD logstash system = ***
Changed password for user beats system
PASSWORD beats system = ***
Changed password for user remote_monitoring_user
PASSWORD remote monitoring user = ***
Changed password for user elastic
PASSWORD elastic = ***
```

Configure Kibana for TLS and User Authentication

1. Copy CA file to correct path

```
$ cp certs/kibana/elasticsearch-ca.pem kibana/config/
```

2. Add CA file mount do docker-compose.yml

```
services:
kibana:
volumes:
```

```
- ./kibana/config/elasticsearch-
ca.pem:/usr/share/kibana/config/elasticsearch-ca.pem:ro
```

3. Add TLS & authentication information to kibana.yml

```
elasticsearch:
  hosts: [ "https://elk-test-elasticsearch:9200" ]
  ssl.certificateAuthorities: [ "config/elasticsearch-ca.pem" ]
  username: "kibana_system"
  password: "***"
```

4. Restart elk-stack

```
$ docker-compose up -d && docker-compose logs -f
```

kb, elasticsearch
